# Outline of Thesis

**Chap 1**. Introduction

**Chap 2**. Methods and Preliminaries

**Chap 3**. Kondo frustration via charge fluctuations: Mott localisation in $d = \infty$ [New J. Phys. 25 113011]

**Chap 4**. A New Auxiliary Model Mapping For Correlated Lattice Models [New J. Phys. 28 013503]

**Chap 5**. Mott Criticality as the Confinement Transition of a Pseudogap-Mott Metal in $d = 2$ [New J. Phys. 28 013503]

**Chap 6**. Competing tendencies In Heavy Fermion Systems: Kondo screening vs. Mott localisation [in progress]

**Chap 7**. Holographic entanglement renormalisation for fermionic quantum matter [J. Phys. A: Math. Theor. 57 275401]

**Chap 8**. Conclusions

# Introduction To Fermionic Criticality and Quantum Materials

# What Do Condensed Matter Theorists Do?

## Explain Experiments

- Build and solve theoretical models for experiments
- Compute measurables to explain observations
- Kondo effect, quantum Hall effect, superconductivity

# What Do Condensed Matter Theorists Do?

## Explain Experiments

- Build and solve theoretical models for experiments
- Compute measurables to explain observations
- Kondo effect, quantum Hall effect, superconductivity

## Predict Experiments

- Identify interesting theoretical models for new systems
- Predict novel phenomena by tweaking models and parameters
- Abrikosov vortex lattice, spin liquids

# What Do Condensed Matter Theorists Do?

## Predict Experiments

- Identify interesting theoretical models for new systems
- Predict novel phenomena by tweaking models and parameters
- Abrikosov vortex lattice, spin liquids

## Classify experiments

- organize experimental signatures into universal principles
- come up with frameworks that explain a large class of phenomena
- Examples: Landau theory of phase transition

# Quantum Materials

Class of materials that **cannot** be well-approximated by “classical” description

# Quantum Materials

Class of materials that **cannot** be well-approximated by “classical” description

topological properties
(*topological insulators*)

# Quantum Materials

Class of materials that **cannot** be well-approximated by “classical” description

topological properties
(*topological insulators*)

non-local entanglement
(*spin liquids*)

# Quantum Materials

Class of materials that **cannot** be well-approximated by “classical” description

topological properties
(*topological insulators*)

non-local entanglement
(*spin liquids*)

collective excitations
(*strange metals*)

# Quantum Materials

Class of materials that **cannot** be well-approximated by “classical” description

topological properties
(*topological insulators*)

non-local entanglement
(*spin liquids*)

collective excitations
(*strange metals*)

Needs dramatically **new ideas** and methods!

- **non-local/collective** order parameters for transition
- ability to work with a large number of **interacting particles**
- ability to work with **emergent** degrees of freedom

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

- Transition metal oxides (high-$T_c$ cuprates)
- Transition metal dichalcogenides ($MoS_2$)
- Heavy-fermion compounds ($CeCu_2Si_2$)

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

- Transition metal oxides (high-$T_c$ cuprates)
- Transition metal dichalcogenides ($MoS_2$)
- Heavy-fermion compounds ($CeCu_2Si_2$)

transition metals, rare earths, actinides

unpaired *f* or *d* electrons

Localised *f* and *d* electrons **enhance** effect of correlations.

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

- Transition metal oxides (high-$T_c$ cuprates)
- Transition metal dichalcogenides ($MoS_2$)
- Heavy-fermion compounds ($CeCu_2Si_2$)

transition metals, rare earths, actinides

unpaired *f* or *d* electrons

Localised *f* and *d* electrons **enhance** effect of correlations.

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

## Phenomena: Mott Insulation

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

## Phenomena: Mott Insulation

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

## Phenomena: Mott Insulation

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

## Phenomena: Mott Insulation

- Not accessible from 1-particle theory
- result of **manybody effects**

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

## Phenomena: Mott Insulation

How do we describe the transition from a metal into a Mott insulator?

- Not accessible from 1-particle theory
- result of **manybody effects**

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

## Phenomena: Strange Metallicity

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

## Phenomena: Strange Metallicity

Conventional metallic theory predicts $R \propto T^2$

Source of $R \propto T^2$?

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

## Phenomena: Strange Metallicity

Conventional metallic theory predicts $R \propto T^2$

Source of $R \propto T^2$?

Single particles must propagate finite number of lattice spacing

# Strongly Correlated Phenomena

Materials with strong **local** electronic correlation, **low dimensionality**, multiple electronic **orbitals**

## Phenomena: Strange Metallicity

Conventional metallic theory predicts $R \propto T^2$

**Who is carrying current in strange metals?**

Source of $R \propto T^2$?

Single particles must propagate finite number of lattice spacing

# Theoretical Models of Correlated Materials

## Hubbard Model

# Theoretical Models of Correlated Materials

## Hubbard Model

- Correlated electrons hopping on a lattice

# Theoretical Models of Correlated Materials

## Hubbard Model

- Correlated electrons hopping on a lattice

- Hopping probability is $t$.

# Theoretical Models of Correlated Materials

## Hubbard Model

- Correlated electrons hopping on a lattice

- Hopping probability is $t$.

- Energy cost $U$ if two occupy same site.

# Theoretical Models of Correlated Materials

## Hubbard Model

- Correlated electrons hopping on a lattice

- Hopping probability is $t$.

- Energy cost $U$ if two occupy same site.

**Hamiltonian:** $-t\sum_{i,j,\sigma}(c^{\dagger}_{i,\sigma}c_{j,\sigma} + \text{h.c.}) + \sum_i U n_{i,\uparrow}n_{i,\downarrow}$

# Theoretical Models of Correlated Materials

## Hubbard Model

- Correlated electrons hopping on a lattice

- Hopping probability is $t$.

- Energy cost $U$ if two occupy same site.

**Hamiltonian:** $-t\sum_{i,j,\sigma}(c^{\dagger}_{i,\sigma}c_{j,\sigma} + \text{h.c.}) + \sum_i U n_{i,\uparrow}n_{i,\downarrow}$

## Periodic Anderson Model

- **Multi-orbital** model: one localised, the other delocalised

# Theoretical Models of Correlated Materials

## Hubbard Model

- Correlated electrons hopping on a lattice

- Hopping probability is $t$.

- Energy cost $U$ if two occupy same site.

**Hamiltonian:** $-t\sum_{i,j,\sigma}(c^{\dagger}_{i,\sigma}c_{j,\sigma} + \text{h.c.}) + \sum_i U n_{i,\uparrow}n_{i,\downarrow}$

## Periodic Anderson Model

- **Multi-orbital** model: one localised, the other delocalised

- Electrons can hop across orbitals

# Theoretical Models of Correlated Materials

## Hubbard Model

- Correlated electrons hopping on a lattice

- Hopping probability is $t$.

- Energy cost $U$ if two occupy same site.

**Hamiltonian:** $-t\sum_{i,j,\sigma}(c^{\dagger}_{i,\sigma}c_{j,\sigma} + \text{h.c.}) + \sum_i U n_{i,\uparrow}n_{i,\downarrow}$

## Periodic Anderson Model

- **Multi-orbital** model: one localised, the other delocalised

- Electrons can hop across orbitals

**Hamiltonian:** $H_{\text{Hub}} + H_{\text{hop}} + V\sum_{i,\sigma} f^{\dagger}_{i,\sigma}c_{i,\sigma} + \text{h.c.}$

# Quantum Impurity Models as Auxiliary Models

Lattice models of correlated electrons are **hard to solve** directly.

Correlated lattice model

All sites have local correlation

**Idea**: replace full problem with a simpler **auxiliary model** that captures the local correlations.

# Quantum Impurity Models as Auxiliary Models

Lattice models of correlated electrons are **hard to solve** directly.

Correlated lattice model

All sites have local correlation

**Idea**: replace full problem with a simpler **auxiliary model** that captures the local correlations.

Auxiliary model

# Quantum Impurity Models as Auxiliary Models

Lattice models of correlated electrons are **hard to solve** directly.

Correlated lattice model

All sites have local correlation

**Idea**: replace full problem with a simpler **auxiliary model** that captures the local correlations.

Auxiliary model

Small subsystem carries local information

Othere sites replaced by simpler "bath"

**Example: Mean-field solution of Ising model**

$$H = \sum_{i,j} J_{i,j} S_i^z S_j^z$$

# Quantum Impurity Models as Auxiliary Models

Lattice models of correlated electrons are **hard to solve** directly.

Correlated lattice model

All sites have local correlation

**Idea**: replace full problem with a simpler **auxiliary model** that captures the local correlations.

Auxiliary model

Small subsystem carries local information

Othere sites replaced by simpler "bath"

**Example: Mean-field solution of Ising model**

$$H = \sum_{i,j} J_{i,j} S_i^z S_j^z$$

**Mean-field** approximation:

$$H = \sum_i h_{\text{eff}} S_i^z$$

# Quantum Impurity Models as Auxiliary Models

Lattice models of correlated electrons are **hard to solve** directly.

Correlated lattice model

All sites have local correlation

**Idea**: replace full problem with a simpler **auxiliary model** that captures the local correlations.

Auxiliary model

Small subsystem carries local information

Othere sites replaced by simpler "bath"

**EXAMPLE: MEAN-FIELD SOLUTION OF ISING MODEL**

$$H = \sum_{i,j} J_{i,j} S_i^z S_j^z$$

**Mean-field** approximation:

$$H = \sum_i h_{\text{eff}} S_i^z$$

Environment replaced by effective field

# Quantum Impurity Models as Auxiliary Models

More details

- discuss Kondo screening
- discuss Kondo breakdown
- argue how LFL and LM can be thought of as metallic vs insulating behaviour

# Questions

- Questions about solving models
- Questions about developing methods
